

Biomimetic nanopore to design “smart” membranes

Sébastien Balme

*Institut Européen des Membranes
Université de Montpellier, CNRS, ENSCM
sebastien.balme@umontpellier.fr*

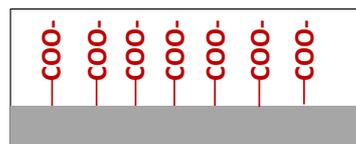

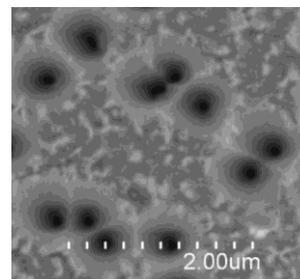

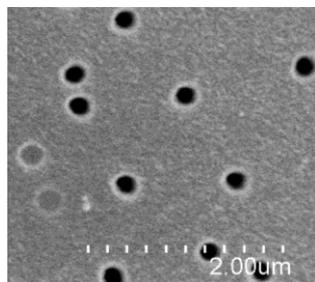

Polymer nanopore How obtain a single nanopore ?

Advances in colloid and interface science DOI 10.1016/j.cis.2017.09.001

Track

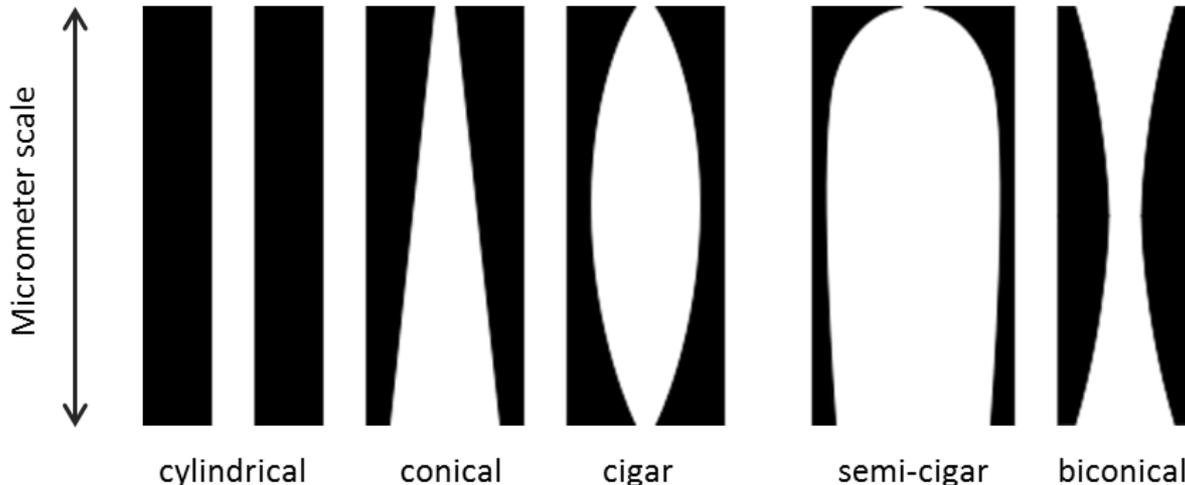

Etching

Kr, Xe (Mev)

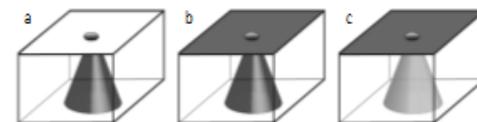

1 ion = 1 pore

Polymeric nanopore drilled by track-etched technique

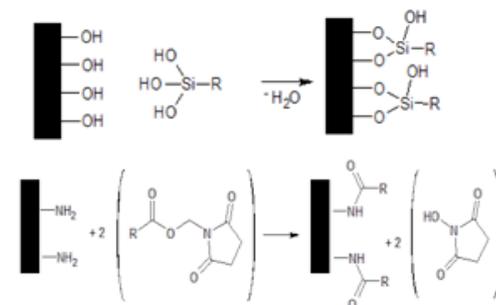

Functionalisation

Deposition

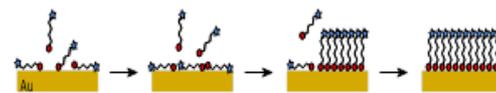

Plasma modification

Chemical modification

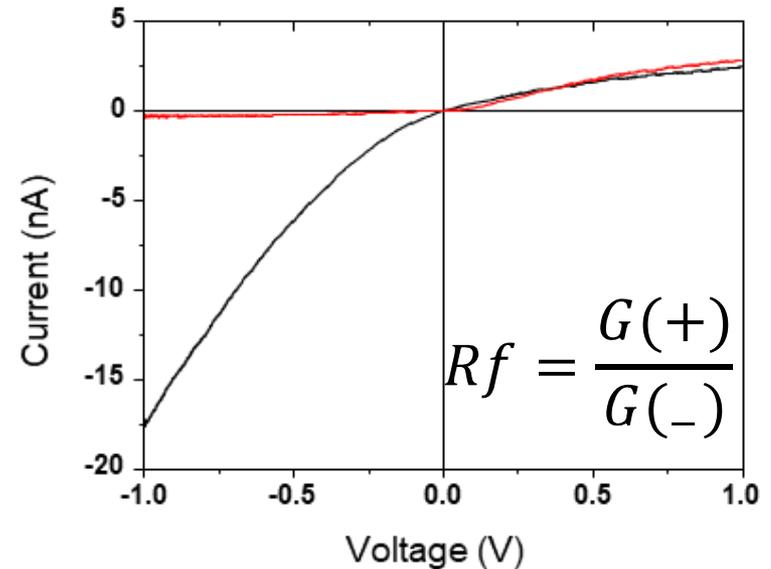

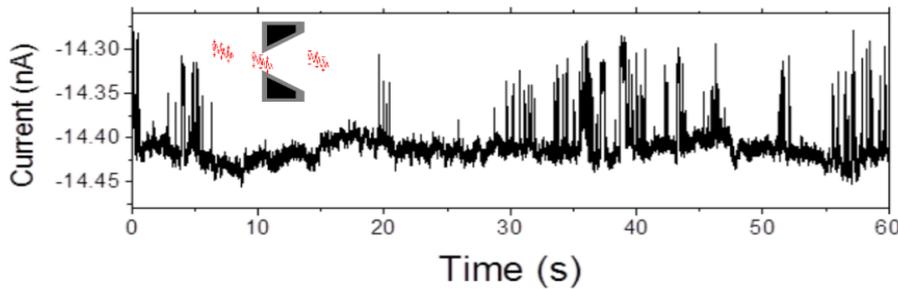

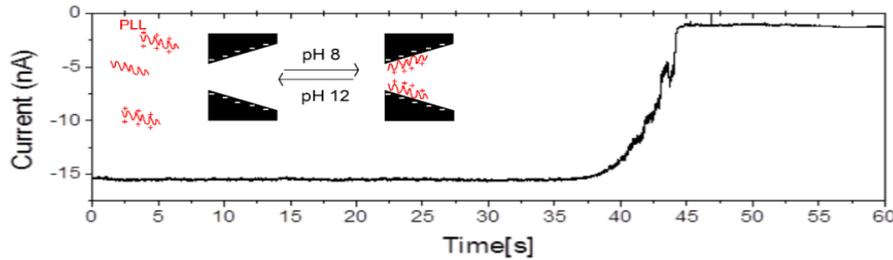

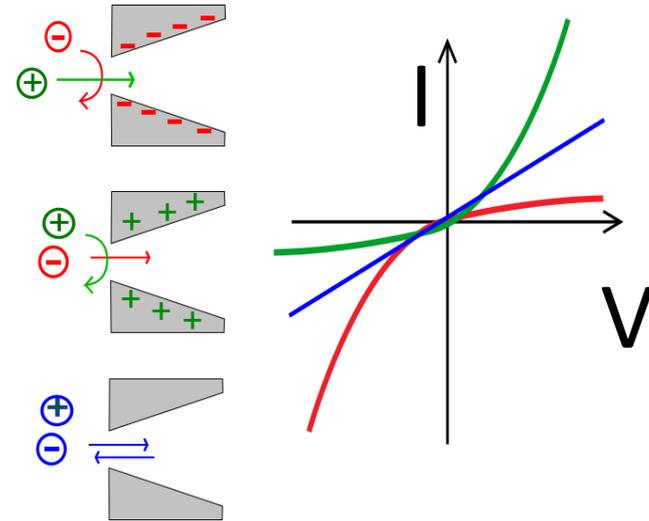

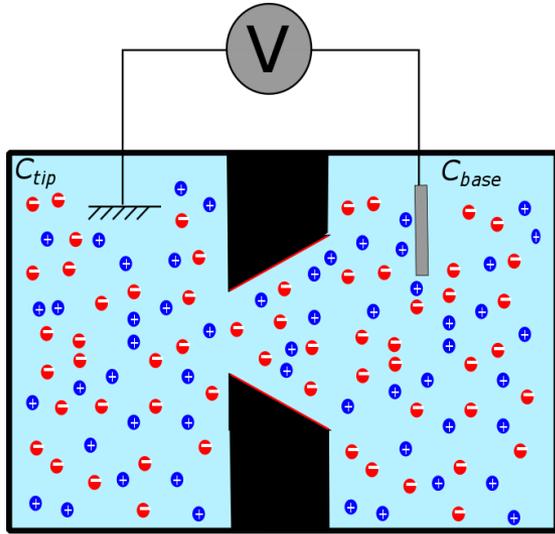

Self-assembled layer(s)

Ionic diode

Using Polyelectrolyte adsorption to modify the ionic transport

RSC Advances, **6**, 32228, (2016)

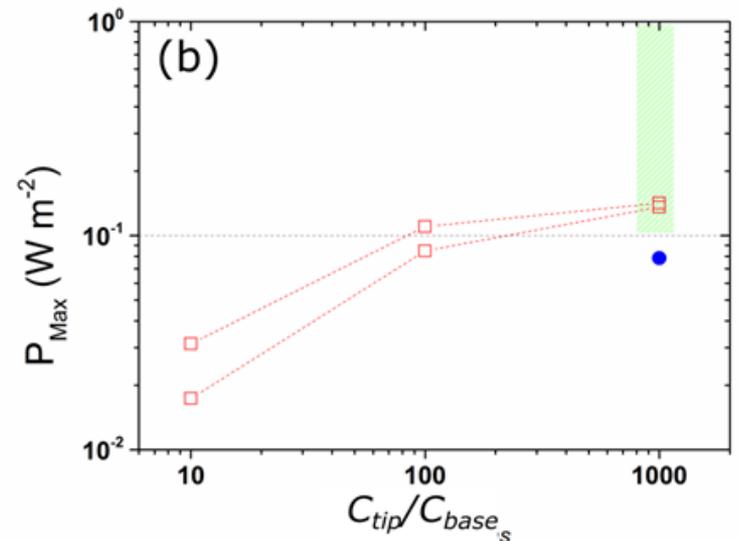

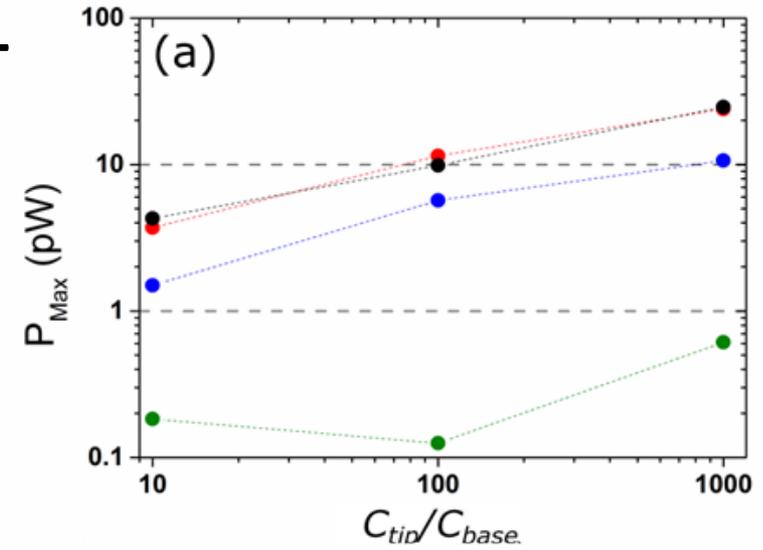

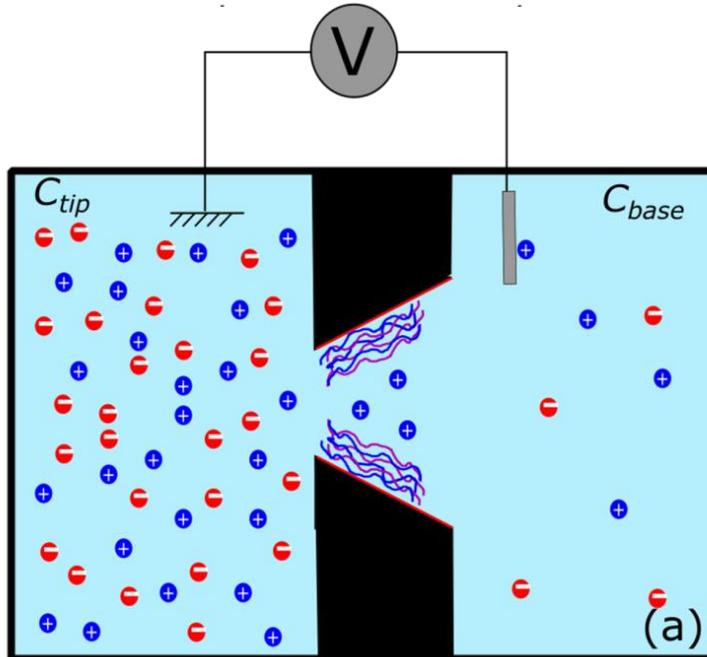

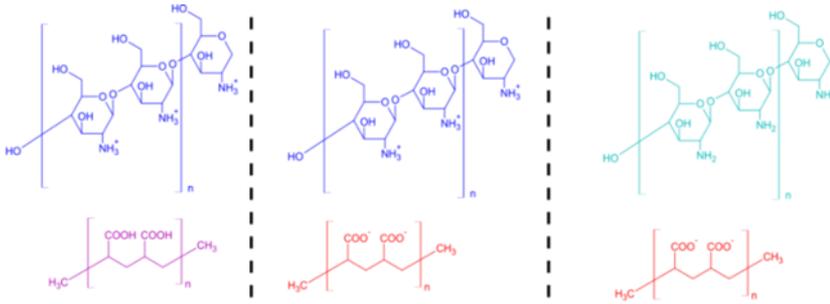

Ionic diode

Mimic ionic channel for osmotic energy

J Membrane science, **544**, 18-24 (2017)

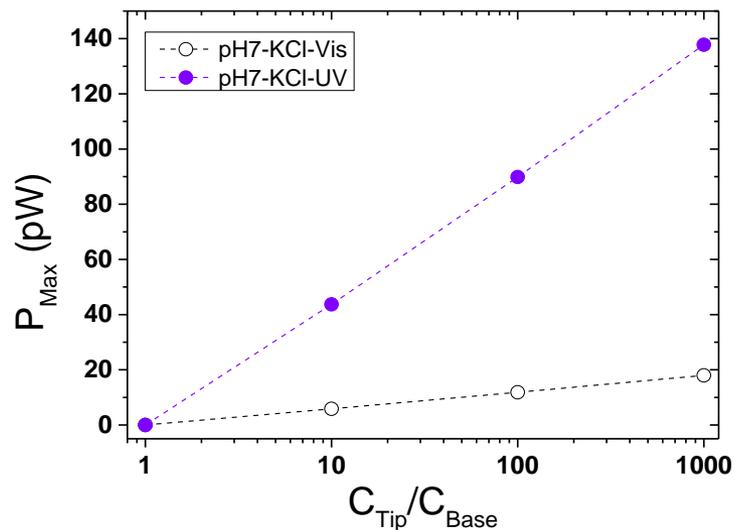

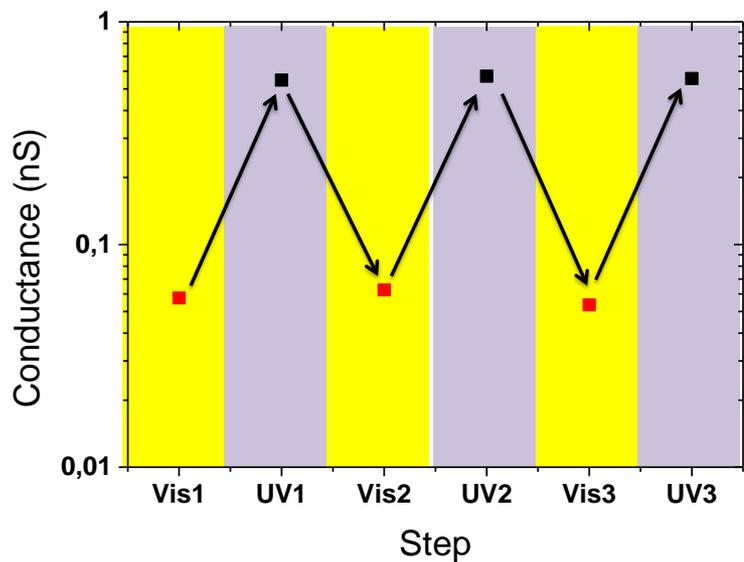

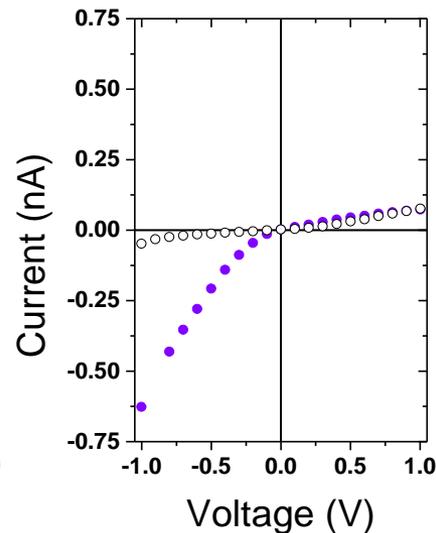

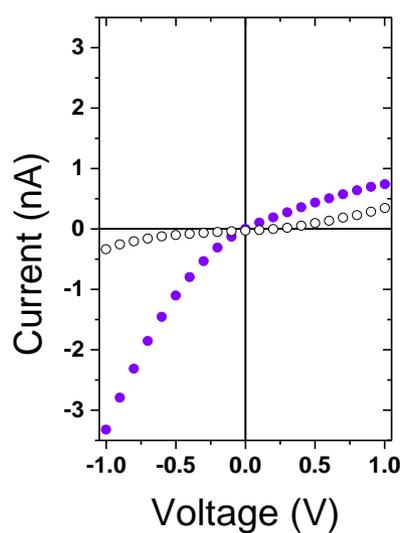

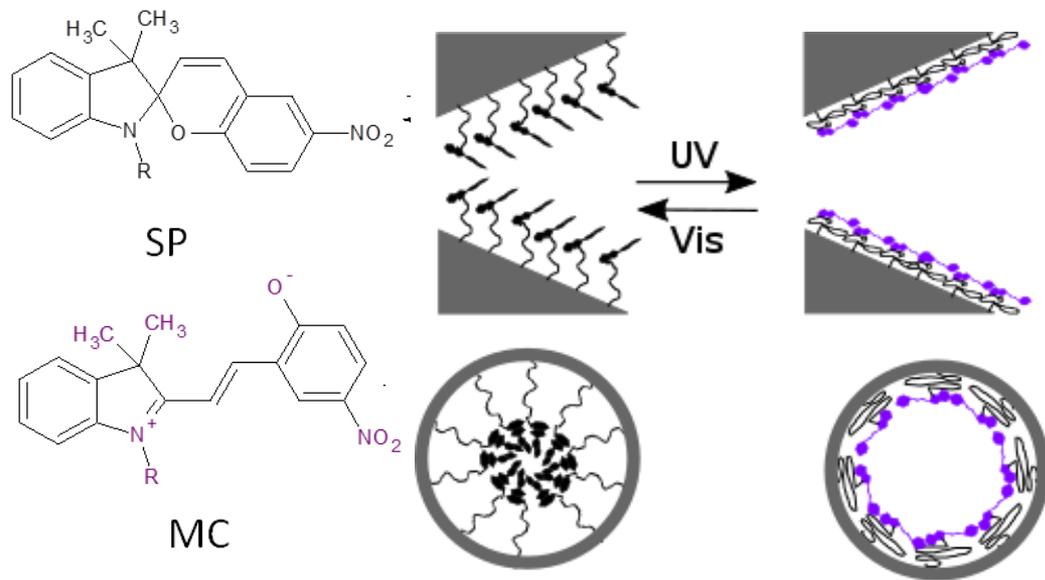

$$I_{osm} \approx \frac{2\pi R\sigma k_B T}{L \eta \lambda_B} \log(C_s) \quad \text{Chitosan/PAA LbL}$$

Stimuli-response nanopore

Light-gated using Spiropyrane-PEG self-assembly

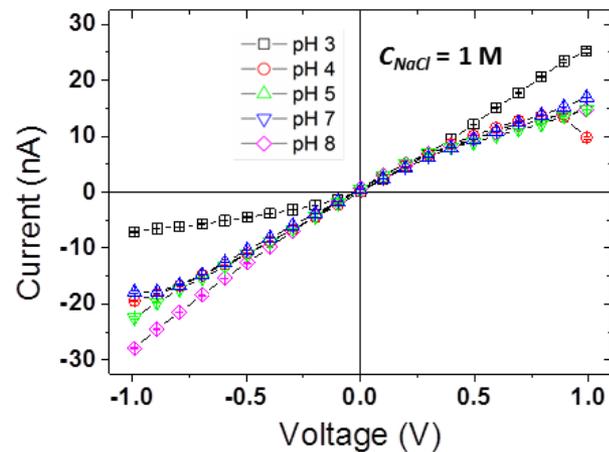

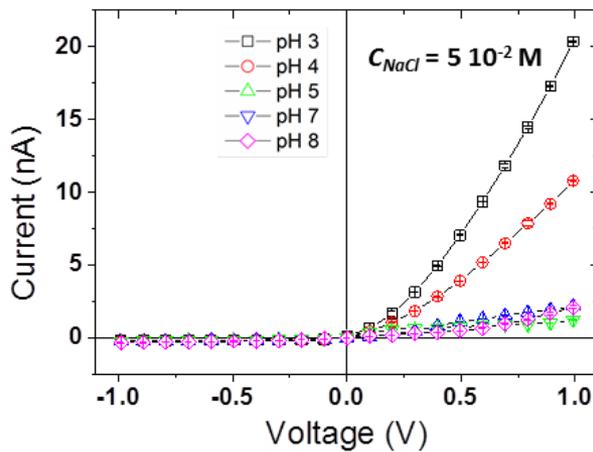

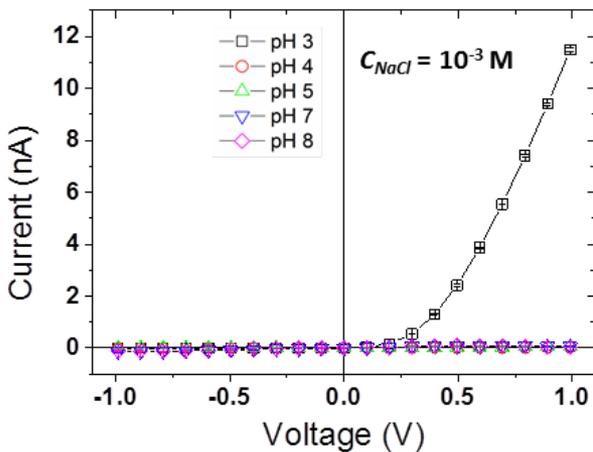

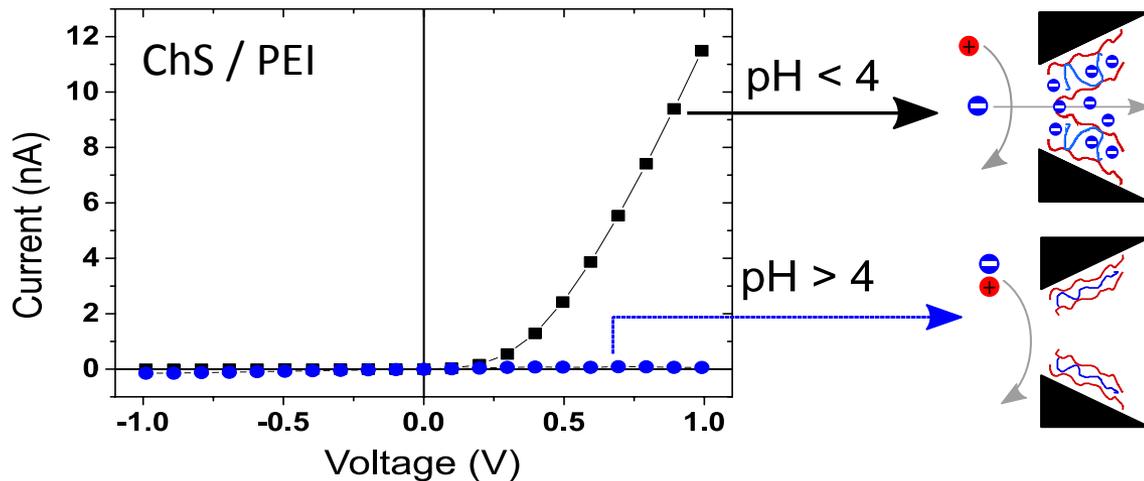

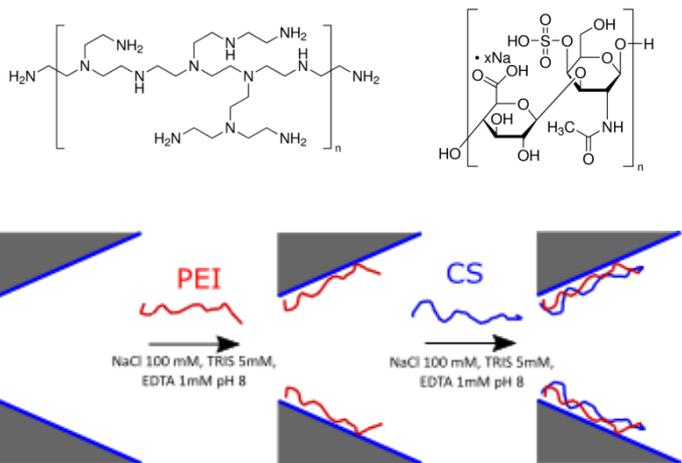

Advanced material interfaces in press(2017)

Stimuli-response nanopore

pH gated regulated by ionic strength

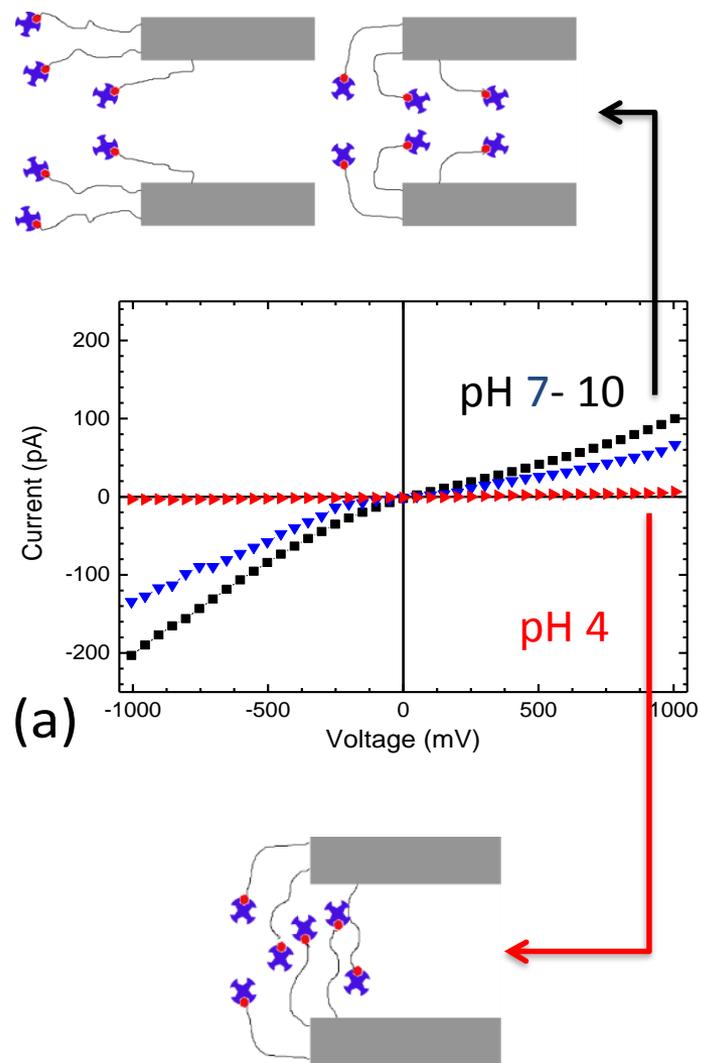

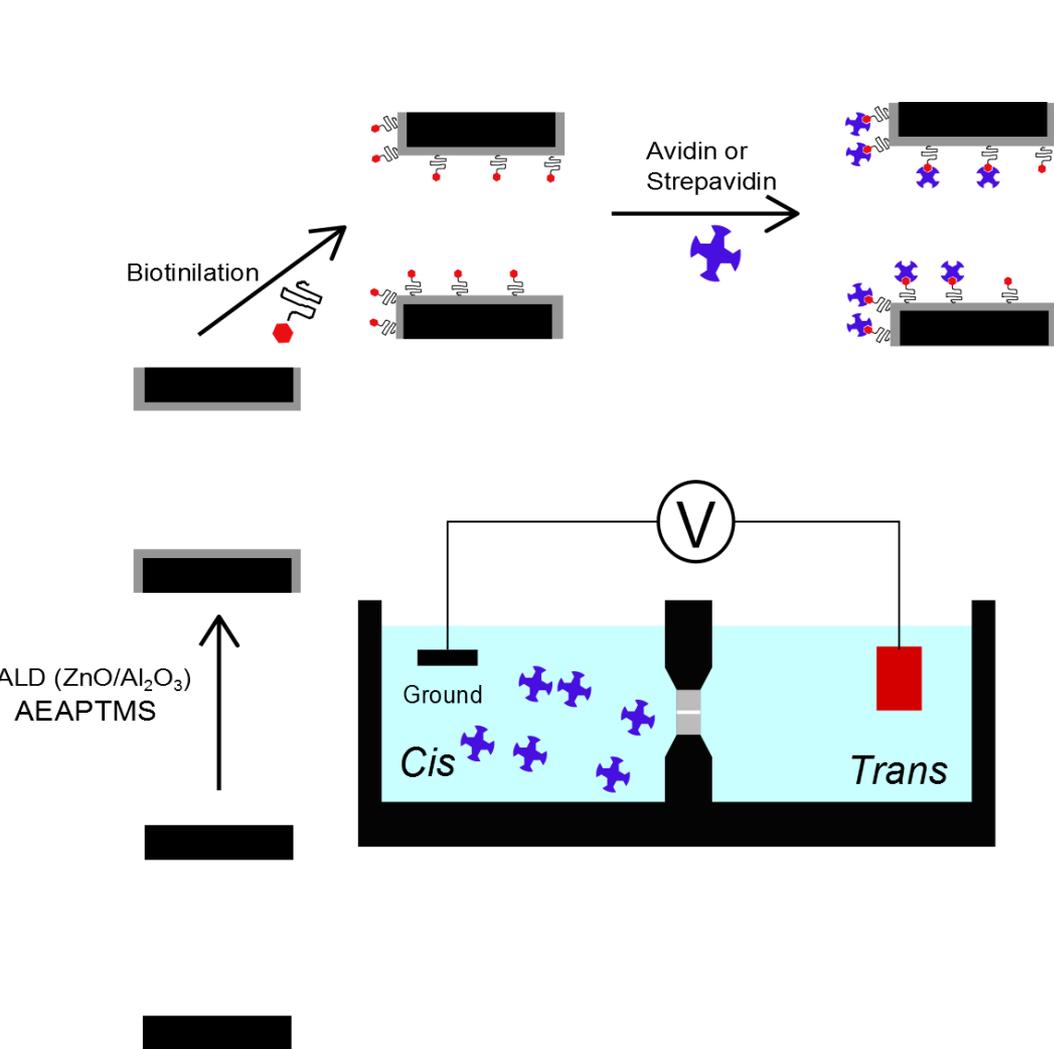

Langmuir, 2017, 33 (14), pp 3484–3490

Stimuli-response nanopore

pH gate by PEG/protein precipitation

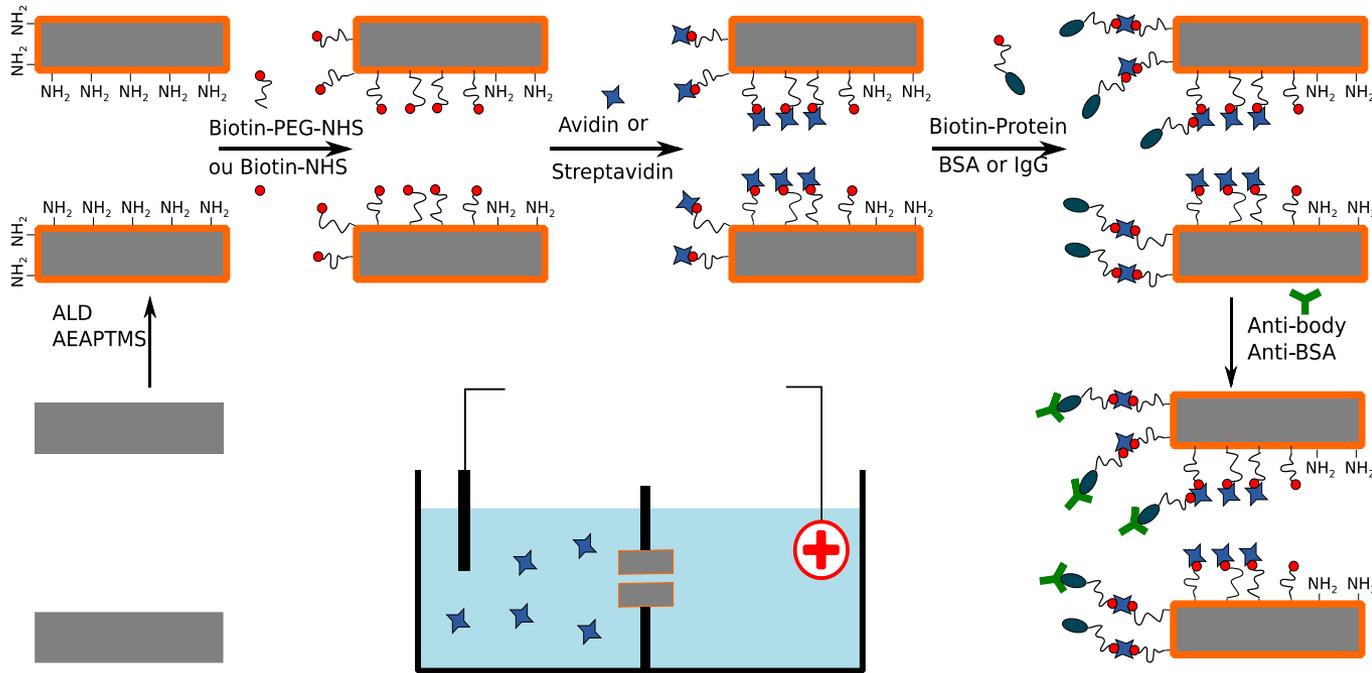

Chemical Communications **51**, 5994-5997 (2015)

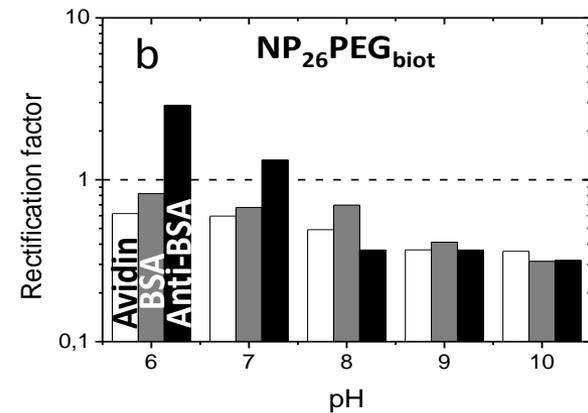

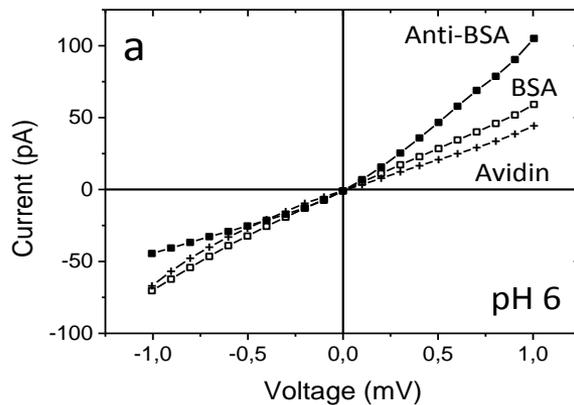

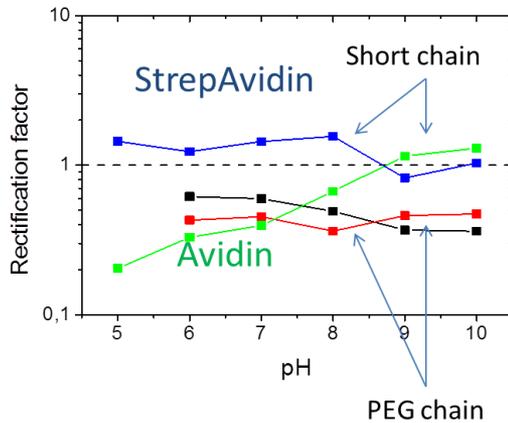

Ligand-responsive nanopore

Biomacromolecules sensing

Electrochimica Acta, **211**, 611–618, (2016).

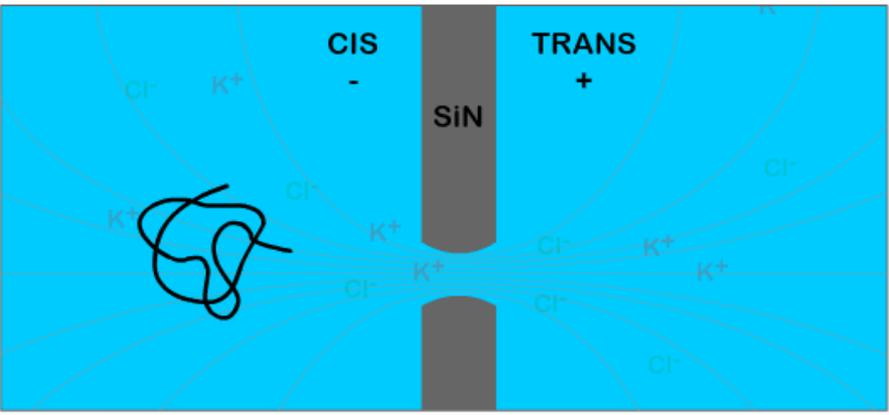

$$Rf = \frac{G(+)}{G(-)}$$

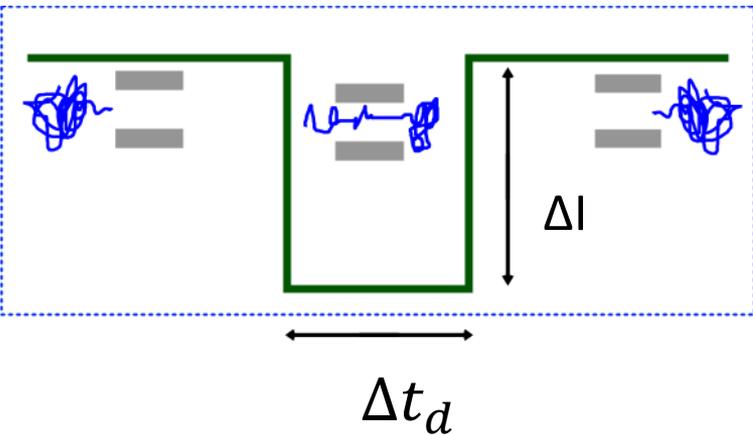

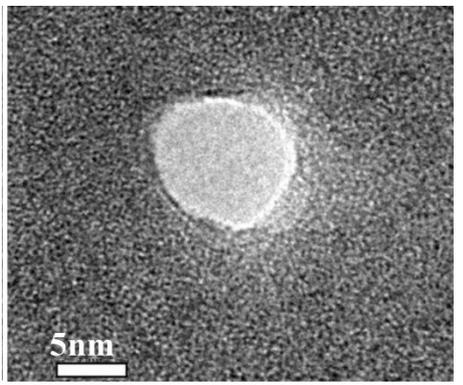

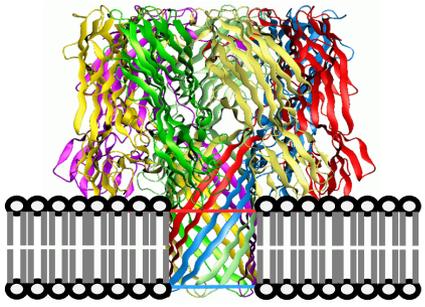

Toxin

Resistive pulse technique for single molecule analysis

- Single molecule sensing

	Biological	SiN	2D	Polymer
Sensitivity	High,	Low	High	Very low
Life time	Hour	Min to hours	Min to hours	weeks
Electric field	high	high	Very high	low
Dwell time	short	short	Very short	long
Noise	Low	High	High	low

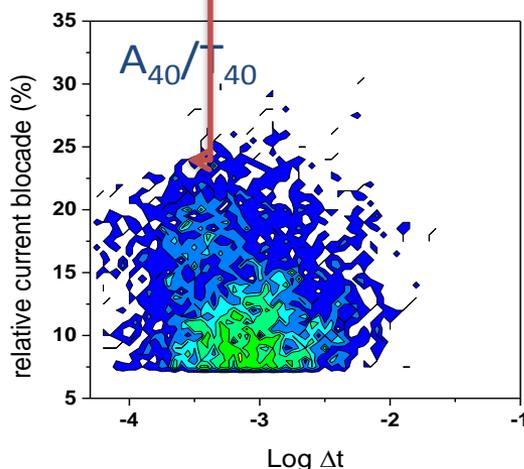

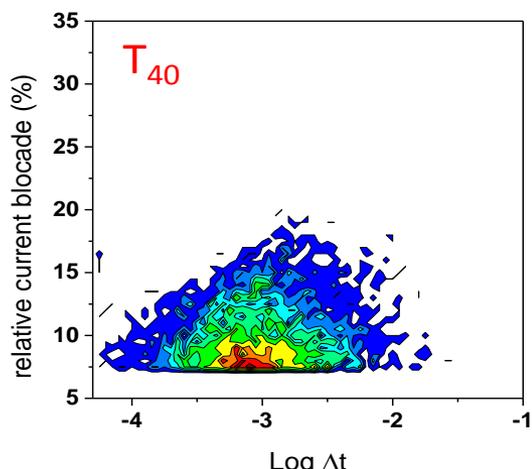

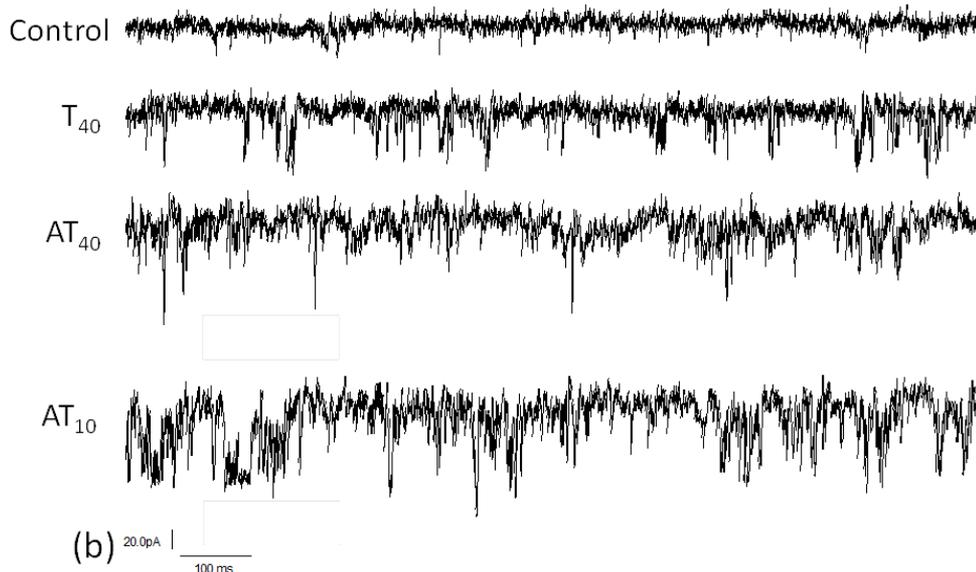

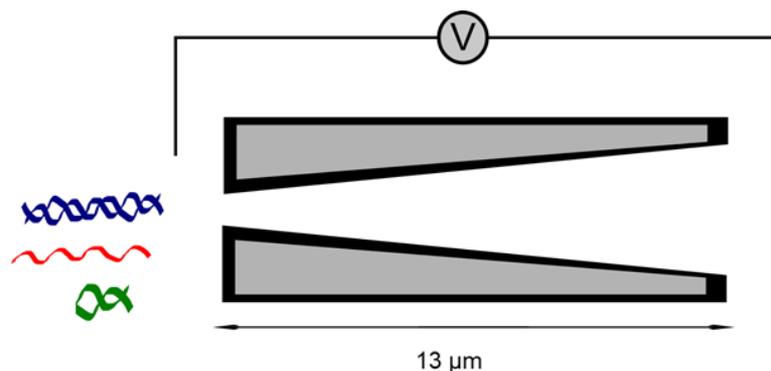

Toxin

Slow DNA translocation

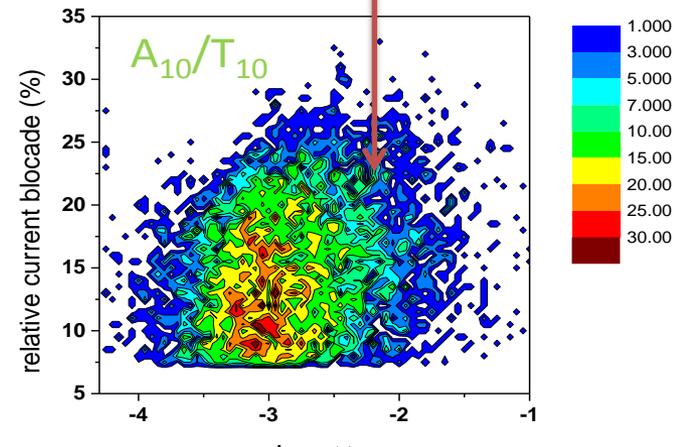

Microchimica Acta, 183, 1011-1017 (2016)

a **long pore length** to decrease the electrostatic field : high aspect ratio tip diameter $\sim 2\text{nm}$

Al_2O_3 coating to reduce the noise

dsDNA

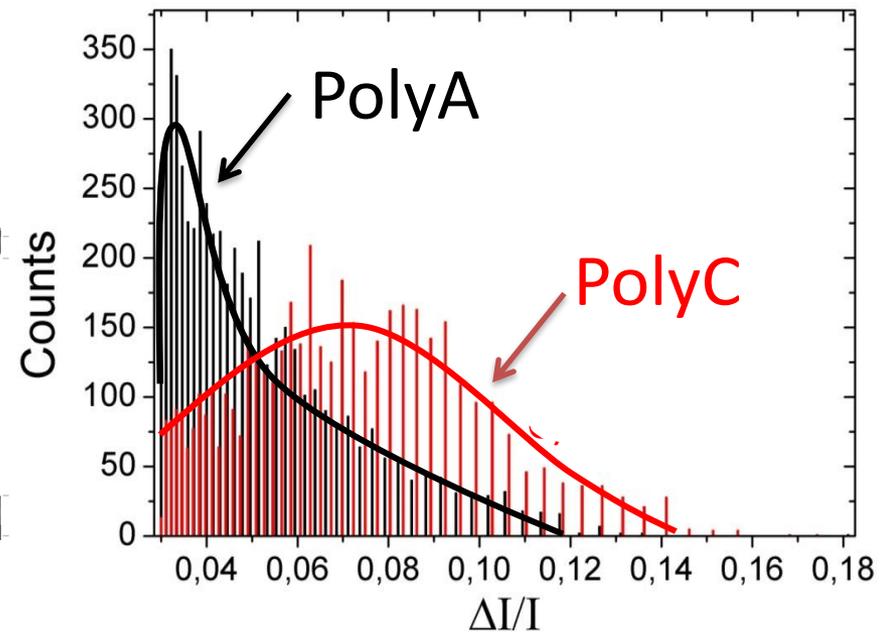

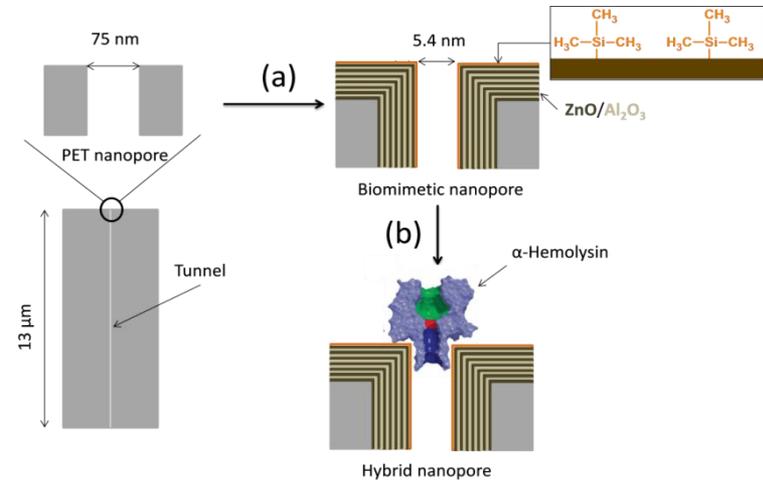

Toxin

Hybrid biological/polymer nanopore

Nanoscale 5, 9582-9586 (2013),

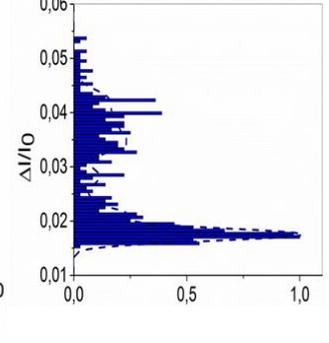

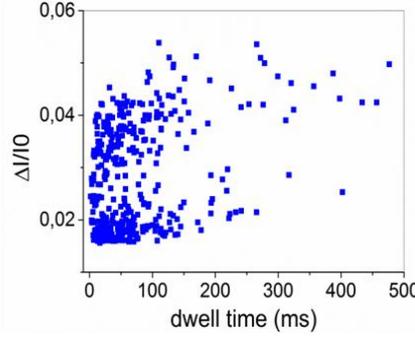

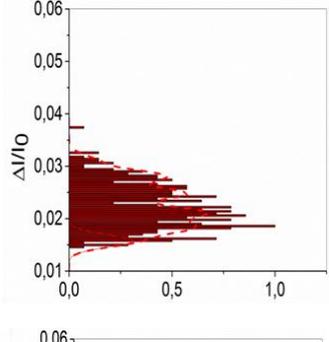

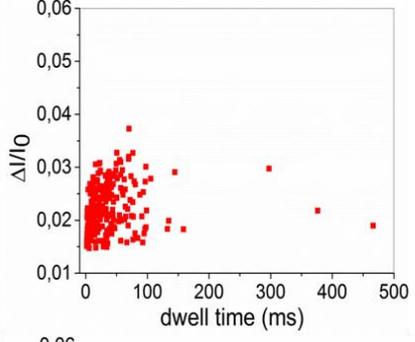

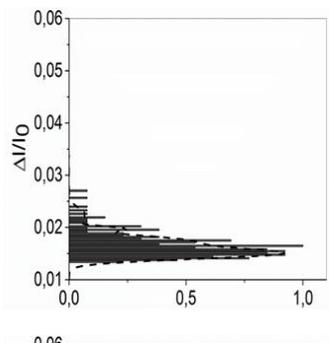

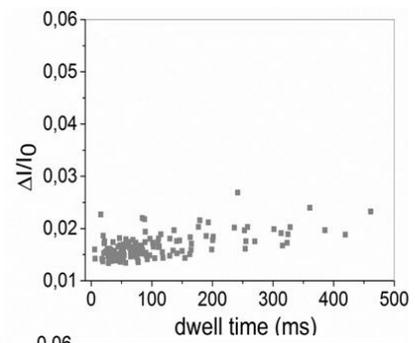

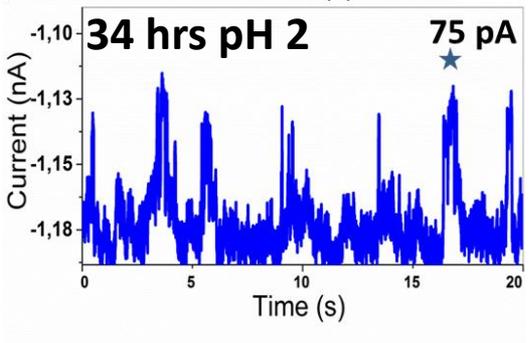

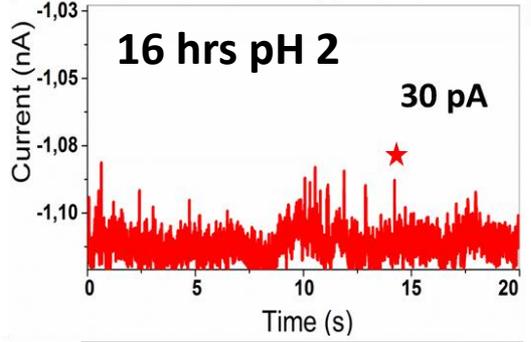

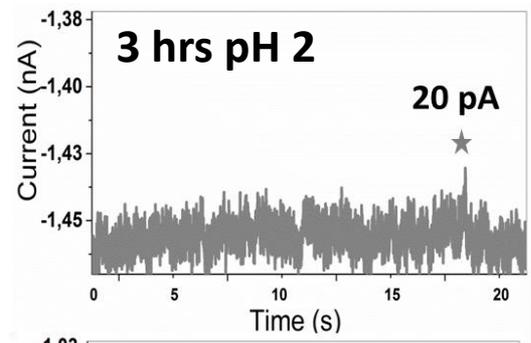

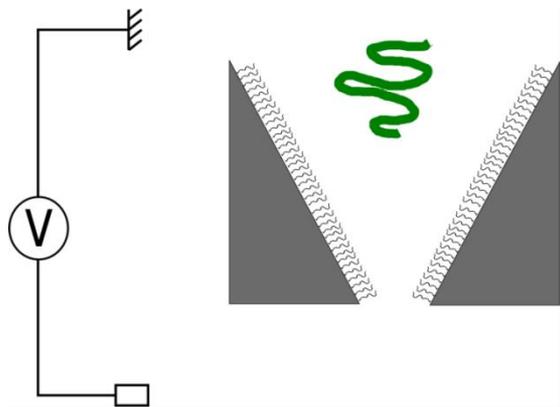

- a **diameter** close to the hydrophobic part of the protein (4 nm),
- **surface functions** which permit to mimic phospholipid chain / α -hemolysin barrel interactions

Toxin

Amyloid fibril detection

Work in progress

Fibril detection

- Correlation size/signal
- Stability 2 month
- Acidic solution

In situ detection

- Degradation
- Maturation
- inhibitor/promotor effect

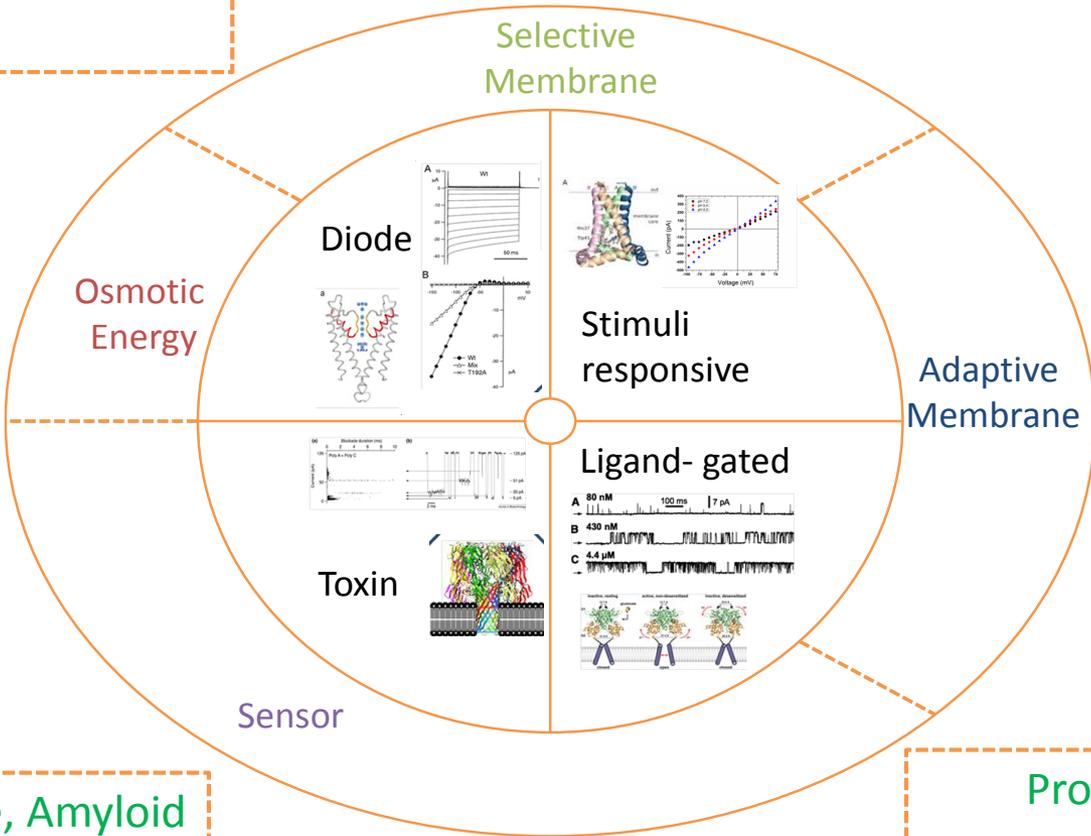

Conclusion

Inspired by the nature to design synthetic membrane

Membrane for osmotic process
Energy production
Logic gate

Cation/Anion
Biomolecule

Ph-gated
Light
Voltage
Temperature
Solvent

Osmotic
Energy

Adaptive
Membrane

Sensor

Protein, aggregate, Amyloid
DNA
Nanoparticle

Protein, antibody
Heavy ion
DNA mismatch/quaduplex
Specific sequence etc..
